Analyzing Word Vectors

Below, you will find a call to sum() on the TWENTIETH row in the sum dimension, but no call to sum() on the FIRST row. So, what happens when you try to add word embeddings of very different magnitudes?

```
[In]: word_vectors.sum(axis=1)[:10]
```

```
[Out]:array([ 1.0000,  1.0000,  1.0000,  1.0000,  1.0000,  1.0000,
              
```
